

CASE STUDY · 3 REAL SIGNALS

3 moves the ILT® Diamond flagged before the breakout.

No profit promises. No after-the-fact storytelling. Just three alerts posted **publicly, timestamped, on X** — and what the market did next. Judge them on the dates.

Why this guide? Most indicators are late: RSI, MACD and moving averages confirm what already happened. The ILT® Diamond looks for the opposite — the **compression and divergence zones** that come before the big moves.

Below are three cases, each timestamped at the moment it was published. Read the context, look at the chart, and see for yourself the read that was made **before** the move.

A **red Diamond** prints above price while the market stalls around 108–109, inside a marked resistance zone. The post is blunt: "here's what to check instead of the news." Within hours, oil breaks down along the divergence trendline and falls to ~91 — about **17 points**, with no news "warning" first.

The read: the Diamond doesn't predict the future — it flags a compression/divergence at a key level. Risk management (stop, position size) stays the trader's job. The signal gives the **zone and the direction**; execution is on you.

SIGNAL DATE

Feb 22, 2026 · 12:08

LEVEL AT SIGNAL

~68,200

WHAT FOLLOWED

~64,388 (~24h)

The "H Bear" label (confirmed bearish divergence) appears as price stalls again below ~68,200, unable to make a higher high despite surface buying pressure. That's exactly the price/momentum mismatch the tool isolates. In under 24 hours, BTC breaks vertically to ~64,388 — nearly **3,800 points** down.

The read: a divergence isn't a countdown — it's a warning of fragility. Combined with a resistance zone and multi-timeframe alignment, it gains reliability. One confirmation is never enough: you wait for **confluence**.

SIGNAL DATE

Oct 10, 2025 · 11:56

READ

HTF reset

WHAT FOLLOWED

Vertical spike

Here, no drop but the opposite: a prolonged **compression** of the VIX, drifting flat in a tight channel. The post warns that "high time frames are resetting" and that "massive moves" are loading. A few sessions later, the VIX **explodes vertically** — exactly the kind of volatility wake-up an extreme compression signals (the GCL engine).

The read: compression doesn't tell you *direction*, it tells you **imminence**. When volatility contracts to an extreme, a large-amplitude move becomes likely — preparing both scenarios beats betting on one.

See these signals on **your** charts.

These three cases come from calls posted publicly on X. The ILT® Diamond works on any TradingView asset — crypto, forex, stocks, commodities — with compression and divergence detection across multiple timeframes.

- ◆ Diamond & divergence alerts on any asset
- ◆ Compression detection (GCL engine) across timeframes
- ◆ Weighted confluence: higher timeframes count more than lower ones
- ◆ Setup in minutes, TradingView access
